THE GREAT FIRE OF LONDON

On Sunday September 1666 a fire broke out in Thomas Farrinor's bakery. Before going to bed Thomas checked that the fires in his bakehouse ovens were out. But smouldering embers ignited. Amazingly only eight people died, but more than half of the area within the city wall's was destroyed, including 13,200 houses, 87 churches and most of London's major public buildings.

How to start a wood fire

Firstly collect small balls of paper. Put them into the fire place carefully. Next add cardboard and then add small sticks into a tepee shape. Now is the time to put paper on the fire. Once that is burnt then the tepee will catch alight and continue to burn. It is important to have an adult around fires so that no one gets burnt. Never use accelerants on a fire because it will explode and cause bad third degree burns. Safely enjoy your fire in winter.

How to quickly start a wood fire

Firstly collect small balls of paper and then carefully put the paper in the fire place. Next place the cardboard and then the twigs into a tepee or pyramid shape. Now put small sticks over the twigs. Next light the paper and then continue to make a pile of fuel next to the fire for the hours to come. It is important to have an adult present so that no people get burnt. Remember, never use accelerants because they are explosive and that is why you should have an adult around. You don't want third degree burns! Safely enjoy your winter fire!
